### Report Overview:

A MEMS (micro-electromechanical system) gyroscope is a small sensor device that measures angular velocity or rotational motion. It works on the principle of Coriolis force, which is the apparent force that acts on an object moving in a rotating reference frame. When a MEMS gyroscope is rotated, the Coriolis force causes a vibrating mass to move in a perpendicular direction to the rotation axis, producing an electrical signal that can be used to measure the angular velocity.
