Report Overview

The inertial measurement unit is a device that measures the three-axis attitude angle (or angular velocity) and acceleration of an object. Generally, an IMU contains three single-axis accelerometers and three single-axis gyroscopes. The accelerometer detects the acceleration signal of the object in the independent three-axis coordinate system of the carrier, while the gyroscope detects the angular velocity signal of the carrier relative to the navigation coordinate system. Measure the angular velocity and acceleration of the object in three-dimensional space, and calculate the posture of the object based on this. It has very important application value in navigation.
