Abstracts

Meniscal fixation devices are medical implants designed to repair tears in the meniscus, a critical load-bearing and shock-absorbing fibrocartilage structure in the knee joint, by providing mechanical stability through sutures, anchors, or all-inside systems that promote healing while preserving native tissue. These devices, which include sutures, screws, darts, and various all-inside implants, are essential in orthopedic surgeries aimed at restoring knee function, reducing pain, and delaying or preventing the onset of osteoarthritis by facilitating meniscal preservation rather than resorting to meniscectomy.
