Report Overview

Mercury batteries, also known as mercury oxide batteries, are a type of primary cell that uses mercury(II) oxide as the cathode and zinc as the anode, with an alkaline electrolyte. These batteries were widely used in small electronic devices such as watches, calculators, hearing aids, and cameras due to their stable voltage output, long shelf life, and high energy density. However, due to environmental and health concerns associated with mercury toxicity, their production and use have been heavily restricted or banned in many countries under regulations like the EU's Restriction of Hazardous Substances (RoHS) Directive and the U.S. Mercury-Containing and Rechargeable Battery Management Act. The market for mercury batteries has significantly declined, with alternatives such as silver oxide, lithium, and zinc-air batteries now dominating applications that once relied on mercury-based cells. Despite their obsolescence in most consumer markets, niche industrial or medical applications may still utilize them in limited quantities where no viable substitutes exist, though this demand is minimal and tightly regulated. The global shift toward eco-friendly and non-toxic power sources has effectively phased out mercury batteries, relegating them to a historical footnote in battery technology.
