Report Overview

A Mesh Pad Demister is a type of mist eliminator used in industries to remove liquid droplets from gas streams. It consists of layers of knitted mesh arranged in a grid pattern to provide a large surface area for droplets to collect and coalesce into larger droplets that can be easily separated from the gas stream. The demister operates based on the principle of impingement and interception, where droplets collide with the mesh fibers and coalesce due to their inertia and surface tension. Mesh Pad Demisters are commonly used in various applications such as chemical processing, oil & gas refining, pharmaceuticals, and power generation to improve process efficiency, protect downstream equipment, and comply with environmental regulations by reducing emissions.

The market for Mesh Pad Demisters is witnessing steady growth driven by several factors. One of the key market trends is the increasing focus on environmental regulations and emission control standards across industries, leading to a higher demand for mist elimination technologies like Mesh Pad Demisters.
