## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Mesh Structured Packing competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Mesh structured packing is a type of high - efficiency packing material used in columns such as distillation, absorption, and extraction<sup>2</sup>. It is made of multilayer metal wire meshes, usually stainless steel, copper, aluminum, or other metal wires<sup>1</sup>. These wire meshes are precisely woven and stacked to form a regular and orderly structure<sup>2</sup>. The mesh structured packing has a large specific surface area, which can provide more contact area for the gas - liquid or liquid - liquid phases, enhancing the mass transfer and heat transfer efficiency<sup>1</sup>. Meanwhile, due to the unique capillary effect of the mesh, its surface has good wettability, which is beneficial for the uniform distribution of liquids on the packing surface<sup>1</sup>. In addition, it features a low - pressure drop, allowing fluids to flow through smoothly, and has a relatively small liquid - holdup, which is especially suitable for the separation of difficult - to - separate materials and heat - sensitive systems<sup>1</sup>.

The global Mesh Structured Packing market size was estimated at USD 348.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
