## Abstracts

Message Broker Platform is a middleware system used to implement asynchronous message delivery and decoupling between distributed applications or services. The platform receives messages sent by producers (Producer) and routes the messages to one or more consumers (Consumer) according to preset rules (such as topics, tags). For example, the order service in the e-commerce system sends messages to the inventory and logistics system. Storing messages through queues or topics ensures that messages are not lost when consumers are unavailable or processing is delayed. For example, Kafka's log segmentation storage technology can achieve TB-level message persistence. Supporting multiple communication protocols (such as AMQP, MQTT, HTTP) enables seamless docking between different systems. For example, industrial equipment can be connected to the Kafka cluster through the MQTT protocol. As the core infrastructure for enterprise-level application integration and real-time data processing, the message broker platform is experiencing explosive growth in demand. With the popularity of the Internet of Things (IoT), microservice architecture, and real-time data analysis, enterprises are experiencing a surge in demand for efficient and reliable messaging. Typical application scenarios include e-commerce order processing (such as millions of message throughput per second), industrial IoT device communication (such as real-time synchronization of sensor data), and financial trading systems (such as low-latency market push).

The global Message Broker Platform market size was estimated at USD 818.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.10% during the forecast period.
