Abstracts

An mRNA vaccine is a vaccine that uses a molecular copy of messenger RNA to generate an immune response. [1] Such vaccines deliver antigen-coding mRNA molecules into immune cells, which use the designed mRNA as a template to build foreign proteins normally produced by pathogens such as viruses or cancer cells. These protein molecules stimulate an adaptive immune response, teaching the body to recognize and destroy the corresponding pathogen or cancer cell. mRNA is composed of RNA encapsulated in lipid nanoparticles, which protect the RNA strand and facilitate its uptake into cells. Reactogenicity, the propensity of the vaccine to produce adverse reactions, was similar to that of traditional non-RNA vaccines. People prone to autoimmune reactions may experience adverse reactions to messenger RNA vaccines. Compared with traditional vaccines, mRNA vaccines have the advantages of being easy to design, fast in production, low in cost, capable of inducing cellular and humoral immunity, and not interacting with genomic DNA.
