### Report Overview

Metabolism is a set of chemical processes that takes place in a body to maintain its living state. Metabolic rates varies from person to person and depends upon the gender, height, weight, age, muscle to fat ratios, and the current physical rate of activity. Metabolic testing devices are used to find metabolic parameters. Metabolism involves a series of reactions in which a molecule is converted into a product with the help of enzymes. Enzymes are vital to metabolism as they allow the organism to drive reactions for required energy. Metabolism is bifurcated into catabolism and anabolism. Catabolism is the breakdown of molecules to obtain energy, whereas anabolism is the building up of complex molecules to form a compound to store energy.
