Abstracts

The metal 3D printing system is a high-tech laser selective melting technology that uses high-power and high-density lasers to selectively melt the metal powder laid out on the substrate of the processing chamber according to the contour information of the current layer to process the current layer. Contour, the lifting system lowers a layer, and the powder spreading system spreads a layer of metal powder on the current layer for laser melting again until the entire part is processed. The main materials used in metal 3D printing systems include stainless steel, titanium alloys, aluminum alloys, etc. The molding size and accuracy vary according to different types of equipment. The application fields of this technology are very wide, such as aerospace, medical and health systems, auto parts, molds, new material performance research, etc., especially the printing of special-shaped parts with complex structures.
