Abstracts

Metal based bioabsorbable stent is a cardiovascular intervention therapy device made of biodegradable metal materials such as magnesium, iron, zinc, etc. Its main function is to provide temporary support for diseased blood vessels, help restore vascular patency, and gradually be absorbed by the human body after completing the support function, avoiding late complications that may be caused by long-term retention of traditional metal stents (such as stent thrombosis and restenosis). Magnesium alloy stents were first applied in clinical practice, with a fast degradation rate and low support. Iron alloy brackets have high strength, moderate degradation rate, and good biocompatibility, but the problem of iron toxicity needs to be addressed. Zinc alloy stents have low strength. Zinc is an essential element for the human body and has a certain vascular protection effect. The global market size of metal based bioabsorbable stents is continuously growing. Technological progress, market demand, and policy support are the main driving factors. The development of new materials and processes has improved the performance and safety of the stents. The high incidence rate of cardiovascular diseases and the demand of patients for minimally invasive treatment have driven the market growth. The support policies of governments around the world for the biomedical device industry provide a favorable development environment for the market. Major global manufacturers include international giants such as Abbott Laboratories, Biotronik, Medtronic, etc. They have advanced technologies and rich market experience, and their products have been widely used worldwide, occupying a large market share. In recent years, domestic enterprises such as Biotyx Medical and Lepu Medical have also made significant progress. By increasing research and development investment and technological innovation, they have gradually improved product quality and market competitiveness, continuously increasing their market share in the domestic market and beginning to expand into the international market. The main challenges of this industry are technological bottlenecks and market competition. The iron toxicity problem of iron-

based stents and the strength problem of zinc based stents still need to be solved. International manufacturers dominate, and domestic enterprises need to improve their technological level and brand influence. In the future, the research and development of magnesium based, iron-based, and zinc based stents will be further optimized to enhance their clinical efficacy and safety. The application field of metal based bioabsorbable stents will expand from cardiovascular diseases to peripheral arterial diseases and other fields. With the rise of emerging markets such as Asia and Latin America, the market size of metal based bioabsorbable stents is expected to further expand.

The global Metal Based Bioabsorbable Stent market size was estimated at USD 1120.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
