Report Overview

Metal-based boundary lubrication bearings are bearings that use metal-based materials and utilize the principle of boundary lubrication for lubrication. It coats a layer of special lubricant or adds solid lubricant on the surface of the metal substrate to form a lubrication method that can form a lubricating film in the friction contact area. The working principle of metal-based boundary lubrication bearings is to form a lubricating film in the friction contact area through lubricant or solid lubricant, reducing direct contact between metals, thereby reducing friction and wear. This lubrication method is suitable for bearing applications under high temperature, high speed, high load and harsh working environment.

The global Metal Based Boundary Lubricated Bearings market size was estimated at USD 785.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
