Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Metal Based Precursor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Metal based precursors refer to metal chemical precursors used for synthesizing semiconductor materials, which are converted into semiconductor materials through methods such as pyrolysis, reduction, and chemical vapor deposition (CVD). These precursors provide metal ions or metal sources, which form materials with semiconductor properties through subsequent chemical reactions and are widely used in integrated circuits, solar cells, optoelectronic devices, sensors, and other fields. In 2024, global Metal Based Precursor production reached approximately 535 MT, with an average global market price of around US\$ 2,738 per MT. The annual production capacity of a single production line is 5-10 tons, and the gross profit margin is about 50%. Upstream raw materials: High-purity metal/metal source: such as ultra-high-purity hafnium ingots, zirconium ingots, titanium ingots, etc. High-purity organic ligands: such as dimethylamine, diethylamine, acetylacetone, etc., need to reach electronic grade purity. Downstream application areas: integrated circuit chips, flat panel displays, solar photovoltaics. Raw material cost: 45%-65%; manufacturing overhead: 20%-35%; labor cost: 5%-15%.

The global Metal Based Precursor market size was estimated at USD 1465.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
