### Report Overview

Metal-based self-lubricating bearings are bearings that use metal materials as the base and are coated with a layer of self-lubricating material on the surface. They are used to operate under harsh conditions such as high temperature, high speed, and high load. Self-lubricating materials are usually composite materials composed of one or more solid lubricants and one or more polymer materials, which can automatically release and replenish lubricating oil when the bearing is running, thereby achieving long-term stable operation of the bearing. Metal-based self-lubricating bearings have excellent properties such as wear resistance, high temperature resistance, corrosion resistance and fatigue resistance. They are suitable for high-end equipment and important parts in aviation, aerospace, military industry, machinery and other fields. They are a high-performance bearing type.

The global Metal Based Self Lubricating Bearings market size was estimated at USD 685.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
