Abstracts

Metal bond dicing blades are precision cutting tools used primarily in semiconductor manufacturing and electronics assembly, designed to slice through hard, brittle materials such as silicon wafers, ceramics, glass, and compound semiconductors with minimal chipping or material loss. These blades consist of diamond abrasives embedded in a metal matrix?typically composed of cobalt, bronze, iron, or tungsten?which provides high wear resistance, thermal stability, and structural integrity, ensuring consistent performance during high-speed dicing processes where dimensional accuracy and surface quality are critical. The metal bond formulation can be tailored to match specific material properties and cutting conditions, balancing between hardness, toughness, and abrasive retention to optimize blade life and cut quality.

The global Metal Bond Dicing Blades market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
