Abstracts

Metal Borides are a class of inorganic compounds composed of Boron (B) and a metal element. Characterized by the formation of strong covalent B-B bonds and metallic M-B bonds, metal borides are classified as refractory ceramics or intermetallic compounds. Due to their unique crystallographic structures which feature complex boron networks like chains (B), two-dimensional layers (B₂), or three-dimensional cages (B₄, B₆, B₁₂) they exhibit exceptional properties. These include extremely high hardness, high melting points, good electrical conductivity, and chemical inertness. Consequently, metal borides are essential in advanced industrial applications such as high-temperature structural components, cutting tools (due to their hardness), and electron emitters (like LaB₆).

The global Metal Borides market size was estimated at USD 150.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
