Abstracts

Metal-coated hollow ceramic microspheres refer to a type of ceramic microsphere material with a hollow structure and a metal layer covering the surface. Ceramic microspheres are usually made of ceramic powder through expansion technology or other processes and have a hollow structure. The metal coating may include metals such as nickel and silver, which are evenly covered on the surface of the ceramic microspheres through chemical plating or other processes. Since the ceramic microspheres themselves have a hollow structure, the overall material density is low, which is conducive to reducing weight. The metal coating gives the material good conductivity, making it widely used in fields such as electromagnetic shielding.

The global Metal-Coated Hollow Ceramic Microspheres market size was estimated at USD 131.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
