Abstracts

Self-lubrication is characterized by the bearings ability to transfer microscopic amounts of material to the mating surface. This transfer process creates a film that provides lubrication and reduces friction over the length of the rail or shaft. Metal composite self-lubricating bearings combine the high strength and wear resistance of the metal matrix with the excellent lubricating properties of the solid lubricant. The metal matrix bears the load, while the specially formulated solid lubricant performs the lubrication function.

The global Metal Composite Self Lubricating Bearing market size was estimated at USD 3056.28 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
