## Abstracts

Metal Filament for Additive Manufacturing refers to a type of material specifically designed for 3D printing processes, where metal particles or alloys are combined with a thermoplastic binder. This filament is used in additive manufacturing (3D printing) to create objects with metal-like properties. The filament is typically fed through a 3D printer's extrusion system, where it is heated and deposited layer by layer to build the object. After printing, the object often undergoes post-processing steps such as sintering (high-temperature heat treatment) to remove the binder and fuse the metal particles together, resulting in a solid, durable metal part. Metal filaments can be made from various materials, such as stainless steel, bronze, copper, titanium, and aluminum, and are commonly used for applications requiring high strength, precision, and performance.

The global Metal Filament for Additive Manufacturing market size was estimated at USD 2436.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
