## Abstracts

Metal fluorides are compounds formed by the chemical reaction between metal elements and fluorine. They generally possess high melting points and chemical stability. Metal fluorides are widely used in various industrial sectors such as aluminum smelting, glass manufacturing, ceramics production, and as catalysts and materials for lithium batteries. Some common examples of metal fluorides include calcium fluoride (CaF<sub>2</sub>), aluminum fluoride (AlF<sub>3</sub>), and sodium fluoride (NaF). Due to the high electronegativity of fluorine, metal fluorides typically have strong ionic bonds, giving them excellent chemical stability in high-temperature and high-pressure environments.

The global Metal Fluorides market size was estimated at USD 8462.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
