### Report Overview

Metal grain refiners are materials or additives used in the process of refining the structure of metal grains. The grain structure of a metal refers to the arrangement of individual grains or crystals that make up the material. The size and shape of these grains can affect the mechanical properties of the metal, such as strength, ductility, and toughness. Metal grain refiners are typically added to molten metal alloys before they are cast into their final shape. The working principle of a refining machine is to promote the formation of fine equiaxed grains (grains with roughly the same size and shape in all directions), rather than coarse, elongated grains. This can improve mechanical properties, such as increased strength, ductility, and toughness.
