Abstracts

Metal injection molding (MIM) is a metalworking process in which finely-powdered metal is mixed with binder material to create a "feedstock" that is then shaped and solidified using injection molding. The molding process allows high volume, complex parts to be shaped in a single step. After molding, the part undergoes conditioning operations to remove the binder and densify the powders. Finished products are small components used in many industries and applications. Metal injection molding?MIM?offers a manufacturing capability for producing complex shapes in large quantities. The process utilizes fine metal powders (typically less than 20 micrometers) which are custom formulated with a binder (various thermoplastics, waxes, and other materials) into a feedstock which is granulated and then fed into a cavity (or multiple cavities) of a conventional injection molding machine. After the ?green? component is removed, most of the binder is extracted by thermal or solvent processing and the rest is removed as the component is sintered (solid-state diffused) in a controlled-atmosphere furnace. The MIM process is very similar to plastic injection molding and high-pressure die casting, and it can produce much the same shapes and configuration features. However, it is limited to relatively small, highly complex parts that otherwise would require extensive finish machining or assembly operations if made by any other metal-forming process. The global MIM Materials industry has a rather high concentration. The major manufacturers are Indo-MIM, ARC Group, NIPPON PISTON RING, GIAN, OptiMIM (Form Technologies), Schunk, etc. In the world, the consumption regions of Metal Injection Molding Materials are mainly North America, Europe and Asia-Pacific. Asia-Pacific is the largest consumption area in the world, which accounts for over 35% of the total share. MIM Materials downstream is wide and recently MIM Materials has acquired increasing significance in various fields of Industry, Automotive, Industrial Components, Electronics, Medical & Dental, Firearms, Consumer Products, others. MIM Materials can be mainly divided into Stainless Steel, Steel, Magnetic Alloys, Copper, Other Alloys,

which Stainless Steel captures over 55% of the MIM Parts market.

The global Metal Injection Molding Materials market size was estimated at USD 2453.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
