Abstracts

Metal Injection Moulding(MIM) Technology is an advanced manufacturing process that combines the versatility of plastic injection molding with the strength and integrity of metal to produce complex, high-performance metal parts. The process involves mixing fine metal powders with a thermoplastic binder to form a feedstock that can be injected into molds in the same way as plastic. After molding, the binder is removed through a process called debinding, and the part is then sintered at high temperatures to densify the metal structure. The result is a net-shape or near-net-shape component with mechanical properties comparable to wrought metal.

The global Metal Injection Moulding Mim Technology market size was estimated at USD 4395.33 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.70% during the forecast period.
