Abstracts

Metal Matrix Composites (MMCs) are advanced materials consisting of a metal or alloy matrix reinforced with one or more additional materials, typically in the form of ceramic fibers, particles, or whiskers, which are integrated to enhance specific mechanical, thermal, or physical properties beyond those achievable by the base metal alone. These composites are engineered to combine the ductility and toughness of metals with the high strength, stiffness, and wear resistance of ceramics, resulting in materials that offer superior performance in demanding applications across industries such as aerospace, automotive, electronics, and defense. Key characteristics often include improved strength-to-weight ratios, elevated temperature stability, tailored thermal conductivity, and enhanced resistance to corrosion and fatigue, making MMCs a critical innovation for applications where conventional metals or polymers fall short.

The global Metal Matrix Composites market size was estimated at USD 412.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
