## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Metal Mesh Capacitive Touch Modules competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Metal Mesh Capacitive Touch Modules are made by combining a conductive metal material with a transparent substrate material. They offer high light transmittance and excellent conductivity, and have broad application prospects in the touch screen field. Compared to traditional ITO modules, Metal Mesh offers superior conductivity, optical properties, and flexibility, providing important support for the development of the optoelectronics field. The metal mesh is a key component of Metal Mesh, and the mesh lines serve as the conduction path for current. These mesh patterns can be square, hexagonal, or other shapes. The metal mesh's structural parameters, such as line width, thickness, and spacing, have a significant impact on the performance of the conductive film. Its conductivity and light transmittance are generally in conflict: the better the conductivity, the lower the light transmittance. Therefore, the mesh structure must be carefully designed, and parameters such as line width, thickness, and spacing must be precisely controlled during fabrication to achieve a balance between conductivity and light transmittance.

The global Metal Mesh Capacitive Touch Modules market size was estimated at USD 467.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
