Abstracts

Metal microspheres are a special type of particulate material. Metal microspheres refer to spherical particles made of metal or metal alloys with sizes ranging from micrometers to nanometers. These microspheres may be composed of pure metals or metal alloys and have unique physical and chemical properties. The microspheres have a regular spherical structure, which helps them to be evenly dispersed and stable in various applications. The surface of metal microspheres may be relatively rough and composed of many nano-scale particles, which increases the reactivity and adsorption capacity of their surface.

The global Metal Microspheres market size was estimated at USD 1539.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
