The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Metal-Organic Chemical Vapour Deposition (MOCVD) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Metal-Organic Chemical Vapour Deposition (MOCVD) is an advanced epitaxial growth technology for semiconductors. It enables atomic-level precision deposition of compound semiconductor thin films on monocrystalline substrates (e.g., sapphire, silicon, silicon carbide) through precisely controlled thermal decomposition reactions of metalorganic precursors (e.g., trimethylgallium, trimethylaluminum) and hydride gases (e.g., ammonia, phosphine) in a vacuum reaction chamber. Characterized by controllable deposition rates, high film quality, and precise composition tuning, MOCVD serves as the core technology for producing III-V and II-VI compound semiconductor materials such as gallium nitride (GaN), gallium arsenide (GaAs), and indium phosphide (InP). It is widely used in industrial-scale manufacturing of LEDs, lasers, power electronic devices, and RF components. The core drivers of the MOCVD equipment market primarily stem from surging downstream demand and technological advancements. In the LED sector, the commercialization of Mini/Micro LED display technology is accelerating the need for equipment upgrades, particularly for high-precision, large-size epitaxial wafer production. While the traditional LED lighting market is nearing saturation, emerging applications (e.g., UV LED, automotive lighting) continue to provide steady growth. In the power electronics sector, the rapid expansion of new energy vehicles (NEVs), photovoltaics, and energy storage is driving demand for SiC/GaN power devices. As a key technology for producing third-generation semiconductor epitaxial layers, MOCVD benefits from the industry's shift toward wide-bandgap materials. Additionally, the demand for high-performance GaN-on-SiC epitaxial

wafers in 5G base stations and defense RF devices further stimulates equipment investments. Policy support (e.g., China's 14th Five-Year Plan for semiconductors, global carbon neutrality goals) is also accelerating capacity expansion, serving as a long-term growth driver. Future MOCVD equipment will evolve toward higher technical barriers and specialization: Equipment manufacturers are focusing on large-chamber, multi-wafer designs to enhance production capacity, reduce epitaxial wafer costs, and improve uniformity and yield (e.g., 8-inch SiC epitaxial equipment). Smart manufacturing and process optimization—leveraging AI for real-time monitoring of gas flow, temperature, and other parameters—will minimize material waste. In terms of market dynamics, the industry is shifting from LED dominance to high-end applications like SiC/GaN, requiring equipment suppliers to adapt to differentiated demands (e.g., AIXTRON's G10-SiC model for power electronics). Geographically, China, backed by policy support and local supply chain advantages (e.g., AMEC, NAURA), is gradually breaking the monopoly of Western manufacturers. Long-term growth may come from emerging technologies like perovskite photovoltaics and quantum dots, though breakthroughs in materials and processes are still needed.

The global Metal-Organic Chemical Vapour Deposition (MOCVD) market size was estimated at USD 687.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
