## Abstracts

Metal-organic framework materials are porous crystalline materials formed by metal ions (or metal clusters) and organic ligands connected by coordination bonds. The metal ions in MOF are usually transition metal ions, such as aluminum, iron, calcium, magnesium, etc., or other metal elements with coordination ability. These metal ions play a role in structural support and provide catalytic active sites in MOF. Organic ligands are usually organic molecules containing carboxyl groups, nitrogen groups or other functional groups that can coordinate with metal ions. They are connected to metal ions through coordination bonds to form the porous structure of MOF. Common organic ligands include organic acids (such as uric acid, benzoic acid, acetic acid, etc.) and other organic compounds.

The global Metal Organic Framework Material market size was estimated at USD 374.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
