Abstracts

Metal oxide thin-film transistor (TFT) backplanes represent a key enabling technology for advanced display applications, particularly in the high-resolution and large-format display markets, where they serve as the electronic switching matrix that controls individual pixels in active-matrix displays such as OLEDs, microLEDs, and high-performance LCDs. These backplanes utilize semiconductors based on metal oxides?such as indium gallium zinc oxide (IGZO)?which offer superior electron mobility, lower power consumption, and better uniformity compared to traditional amorphous silicon (a-Si) backplanes, while remaining more cost-effective and easier to manufacture at scale than low-temperature polycrystalline silicon (LTPS) alternatives. The defining characteristics of metal oxide TFTs include their ability to support higher pixel densities, enable faster refresh rates, reduce energy usage?especially in always-on or portable devices?and provide excellent stability under bias stress, making them especially suited for premium smartphones, tablets, high-end monitors, and emerging applications like flexible and transparent displays.

The global Metal Oxide Tft Backplanes market size was estimated at USD 1850.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
