Abstracts

Metal-plastic polymer self-lubricating rolled bearings are a type of bearing that is made of a metal matrix (such as steel or bronze) and a plastic polymer material (such as PTFE, POM) through a rolling process. The metal layer provides the bearing with strength and rigidity, and the polymer layer has excellent self-lubricating and wear-resistant properties, allowing it to operate stably under low or medium speed, oil-free or low-oil lubrication conditions. This type of bearing does not require external lubricating oil, which can significantly reduce equipment maintenance costs and reduce the impact of lubricants on the environment. Therefore, it is highly favored in fields with high environmental protection requirements.

The global Metal Plastic Polymer Self-lubricating Rolled Bearings market size was estimated at USD 1738.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
