Abstracts

Metal powder atomization is a process used to produce fine metal powders with specific characteristics, there are many methods to produce metal powders from valuable metals and alloys such as titanium, aluminium, stainless steel, iron, copper, nickel-based alloys and cobalt-based alloys. Atomization is generally viewed as the method of choice due to the geometrical properties of the powder particles that can be achieved. This makes it ideal for additive manufacturing (AM). In the atomization process, the melted metal alloys are first refined and degassed, then poured into a gas nozzle, where the liquid material is disintegrated into metal powder by a high-pressure gas stream. Gas atomization, water atomization and direct reduction all rely on industrial gases and gas technologies. Gas atomization requires argon and nitrogen, whereas a hydrogen atmosphere is needed for water atomization followed by oxide reduction. The global core manufacturers of Metal Powder Atomization Plant include Retech Systems, ALD Vacuum Technologies and SMS Group. The top three companies have a market share of about 52 percent. Asia Pacific is the world's largest Metal Powder Atomization Plant market with a market share of about 35%, followed by North America and Europe with a market share of 28% and 25%, respectively. In terms of product type, Gas Atomization System is the largest segment with approximately 80% market share. In terms of application, Metal Powder Manufacturer is the largest downstream segment, accounting for about 86% of the market.

The global Metal Powder Atomization Plant market size was estimated at USD 301.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.50% during the forecast period.
