Report Overview:

Metal power inductors have high power and high inductance value and some of them posses with high temperature co-efficient stability. An inductor is a passive component consisting of two basic parts: a core and a coil. Core material can be ferrite (which is iron) or metal composite. A coil with no core is also considered an inductor. When the current flowing through an inductor changes, the time-varying magnetic field induces an electromotive force (e.g.) (voltage) in the conductor, described by Faraday's law of induction. According to Lenz's law, the induced voltage has a polarity (direction) which opposes the change in current that created it. As a result, inductors oppose any changes in current through them.

The Global Metal Power Inductors Market Size was estimated at USD 1216.96 million in 2023 and is projected to reach USD 3615.68 million by 2029, exhibiting a CAGR of 19.90% during the forecast period.
