Abstracts

Metal salt heat stabilizers are a class of additives used primarily in the processing of polyvinyl chloride (PVC) and related polymers to prevent thermal degradation during high-temperature manufacturing and end-use applications; these stabilizers function by absorbing hydrochloric acid released during decomposition, interrupting autocatalytic degradation reactions, and replacing unstable chlorine atoms in the polymer backbone with more thermally robust groups, typically through the action of metal soaps or complexes containing metals such as calcium, zinc, barium, cadmium, or lead, though regulatory and environmental pressures have driven significant innovation toward heavy-metal-free and mixed-metal systems that balance efficacy, cost, and compliance with global chemical safety standards.

The global Metal Salt Heat Stabilizer market size was estimated at USD 350.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
