Report Overview:

Metal is still the main material of electronic packaging because of its advantages such as good mechanical strength, good thermal conductivity, electromagnetic shielding function and convenient machining. Metal packaging refers to the metal as the main material of the tube shell, directly or indirectly through the substrate to install the chip on the tube seat, with a lead wire connected to the internal and external circuit of an electronic packaging form. It is widely used in the packaging of hybrid circuits, mainly for military, civil and customized special airtight packaging, among which, it has been widely used in the military and aerospace fields. The various forms of metal packaging and flexible processing can be integrated with some components (such as hybrid integrated A/D or D/A converters), suitable for low I/O single chip and multi-chip applications, RF, microwave, optoelectronic, surface acoustic wave and high power devices, can meet the requirements of small batch, high reliability. In addition, in order to solve the problem of packaging heat dissipation, all kinds of packaging also mostly use metal as heat sink and heat sink.

Traditional metal materials include: Cu, Al, Kovar alloy (Fe-Ni-Co alloy), Invar alloy (Ni-Fe alloy), W, Mo alloy and so on.

Most metal packages are physical packages. Metal packaging materials in order to achieve the total piece support, electrical connection, heat dissipation, mechanical and environmental protection, usually have the following requirements; (1) has good heat conduction and heat dissipation; (2) good conductivity, reduce transmission delay and energy loss and sweep; (3) light weight, at the same time requires sufficient strength and mechanical properties; (4) Good processing capacity for mass production; (5) Low

thermal expansion coefficient, in order to meet the match with the chip, thereby reducing the generation of thermal stress; Good welding performance, coating performance and corrosion resistance to achieve reliable combination with the chip, sealing and environmental protection.

The Global Metal Shell for Microelectronic Packages Market Size was estimated at USD 1996.21 million in 2023 and is projected to reach USD 1984.26 million by 2029, exhibiting a CAGR of -0.10% during the forecast period.
