Abstracts

Metal spinning is a method of forming rotationally symmetrical sheet metal parts. In spinning, the sheet metal discs are formed into rotationally symmetrical hollow shapes. The blank is clamped between the shaped spinning mandrel and the tailstock of the spinning machine and rotated by the main drive. The metal disc and the mandrel rotate together and the spinning roller makes contact with the outer face of the workpiece. Using either a CNC or PNC controlled machine the part will take shape as the roller gradually forms the material through a series of programmed passes.

The global Metal Spinning Components market size was estimated at USD 3040.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
