### Report Overview:

Sputtering is the process of forming a thin film when the object is attached to the target substrate by the sputtering and scattering, and the sputtering target is the material for high-speed particle bombardment. Metal Target Materials are kinds of sputtering targets and this report studies the Metal Target Material.

A sputtering target is a material that is used to create thin films in a technique known as sputter deposition, or thin film deposition. During this process the sputtering target material, which begins as a solid, is broken up by gaseous ions into tiny particles that form a spray and coat another material, which is known as the substrate. Sputter deposition is commonly involved in the creation of semiconductors and computer chips. As a result, most sputtering target materials are metallic elements or alloys, although there are some ceramic targets available that create hardened thin coatings for various tools.

The Global Metal Sputtering Target Market Size was estimated at USD 3683.52 million in 2023 and is projected to reach USD 5716.58 million by 2029, exhibiting a CAGR of 7.60% during the forecast period.
