## Abstracts

Metal-supported SOFC (MS-SOFC) is a structure that uses metal or alloy as a fuel cell support. Compared with other supported SOFCs, MS-SOFC has better electrical and thermal conductivity, higher mechanical strength and lower cost. With the rapid economic development, the demand for fossil fuels has also increased. The consumption of fossil energy not only faces a sharp decline in reserves but also serious environmental pollution. The number of internal combustion engine vehicles fueled by petroleum and other primary energy sources has been increasing year by year, and the fixed-source power generation dominated by coal has severely increased the world energy crisis. Therefore, vigorously developing new energy has become one of the important strategies for countries to transform their energy structure. A fuel cell is a high-efficiency and environmentally friendly power generation device with a higher energy density than traditional chemical energy facilities. Among them, the solid oxide fuel cell (SOFC) has developed into a mature technology with wide fuel adaptability. High-grade heat energy while generating electricity has attracted more interest in mobile applications.

The global Metal-Supported SOFC (MS-SOFC) market size was estimated at USD 64.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 22.70% during the forecast period.
