Abstracts

Metalized Ceramic Feedthrough is a special electronic component that is mainly used to transmit electrical signals under conditions such as high vacuum, high pressure or extreme temperature. High-purity, high-insulation ceramic materials such as aluminum oxide (Al₂O₃) or aluminum nitride (AlN) are usually used. A layer of metal (such as gold, silver, copper, etc.) is deposited on a specific area of the ceramic material by vacuum coating, electroplating or other methods to form a conductive path. The metal pin passes through the inside of the ceramic material from one end to the other, forming a conductive path for the electrical signal.

The global Metalized Ceramic Feedthrough market size was estimated at USD 1301.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
