Abstracts

Metallic friction pads are specialized brake components engineered for high-performance applications, characterized by their composition of sintered metal alloys?typically including copper, iron, steel, graphite, and other friction modifiers?which are bonded under heat and pressure to a backing plate. These pads are distinguished by their exceptional thermal stability, durability under extreme conditions, and superior heat dissipation, making them particularly suited for heavy-duty use in automotive racing, industrial machinery, aviation, and heavy commercial vehicles where consistent braking performance at elevated temperatures is critical. Unlike organic or ceramic alternatives, metallic friction pads often exhibit higher noise levels and increased wear on brake rotors but provide robust, fade-resistant braking power essential in demanding environments.

The global Metallic Friction Pads market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
