Abstracts

Metallization base film refers to a specialized polymer substrate, typically composed of materials such as polyethylene terephthalate (PET), polypropylene (PP), or polyethylene naphthalate (PEN), which has undergone a vacuum deposition process to apply a thin, uniform layer of metal—most commonly aluminum—onto its surface. This metallization process enhances the film's functional properties, including improved barrier performance against moisture, oxygen, and light; increased reflectivity; and enhanced electrical conductivity. As a critical intermediate material, metallized base film is widely utilized in packaging (e.g., flexible food and pharmaceutical packaging), capacitors, insulation, decorative applications, and labels, where its combination of flexibility, durability, and tailored functional characteristics meets demanding technical and commercial requirements.

The global Metallization Base Film market size was estimated at USD 2050.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
