Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Metallized Capacitor Film competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Metallized Capacitor Film is made by evaporating a metal layer (usually aluminum and zinc) on one side of the capacitor base film. The metal layer acts as the electrode of the film capacitor. In addition, the metal coating process enhances the insulation resistance capability of the film. If the capacitor base film is damaged by high voltage or other reasons, the metal layer will immediately oxidize, allowing the film to restore insulation resistance without significant performance degradation. The global film capacitor market is showing a strong growth trend, and its development mainly benefits from the rapid expansion of the new energy vehicle industry and the continuous expansion of renewable energy power generation. In the field of new energy vehicles, China, as the world's largest new energy vehicle market, is continuously pushing up the demand for high-performance film capacitors through the accelerated layout of charging infrastructure and the technological upgrade of electric drive systems. At the same time, in the field of new energy power generation, with the in-depth promotion of China's "dual carbon" goals, the large-scale grid connection of clean energy such as solar energy and wind energy and the supporting construction of energy storage systems have significantly increased the demand for power electronic conversion equipment, thereby driving the vigorous development of the film capacitor market. Metallized capacitor film is a polymer film (such as polypropylene (PP), polyester (PET), polyphenylene sulfide (PPS), etc.) coated with an extremely thin metal layer (usually aluminum or zinc-aluminum composite layer) as an electrode through vacuum evaporation or sputtering process. It has the advantages of "self-healing" characteristics, small size, and high reliability. It uses a metal film as an electrode by evaporating a metal film on a thin film

medium. Even if a breakdown occurs under the action of overvoltage, the metallized layer will melt instantly, making the capacitor insulated again, thereby ensuring the normal operation of the capacitor and improving reliability. It is expected that the market will grow rapidly in the future.

The global Metallized Capacitor Film market size was estimated at USD 457.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.20% during the forecast period.
