Abstracts

Metallized glass fiber represents a specialized composite material consisting of glass fiber substrates—typically woven or non-woven fabrics, yarns, or chopped strands—that have been coated with a thin metallic layer, commonly aluminum, silver, nickel, or copper, applied through processes such as vacuum deposition, sputtering, or electroless plating. This metallization imparts enhanced functional properties to the base glass fiber, including significantly improved electrical conductivity, electromagnetic interference (EMI) and radio frequency interference (RFI) shielding capabilities, thermal reflectivity, and corrosion resistance, while retaining the inherent benefits of glass fibers such as high tensile strength, dimensional stability, and fire resistance. These characteristics make metallized glass fibers suitable for demanding applications across industries such as aerospace, defense, telecommunications, electronics, and automotive, where they are utilized in components like conductive gaskets, shielding enclosures, antistatic fabrics, and thermal management systems.

The global Metallized Glass Fiber market size was estimated at USD 485.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.45% during the forecast period.
