Report Overview

Metallographic modifiers are substances or processes used to modify the microstructure of a metal or alloy to improve its mechanical, physical, or chemical properties. Modification of microstructure can improve properties such as strength, toughness, corrosion resistance, and wear resistance. There are several types of metallographic modifiers, such as grain refiners, nucleation agents, inoculants, and modifiers. Grain refiners are used to refine the grain size of a metal or alloy, thereby improving its strength and ductility. Nucleating agents promote the formation of smaller, more uniform grains, thereby improving the mechanical properties of the material. Inoculants are used to change the structure of cast metals and alloys to improve their mechanical properties. Modifiers are used to change the shape, size, or distribution of certain phases or particles in a metal or alloy to improve its properties.
