Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Metallurgically Clad Pipes competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Metallurgically Clad Pipes production reached approximately 470 k tons, with an average global market price of around US\$2010 per ton. Metallurgically clad pipes are bimetallic composite pipes consisting of a base carrier pipe—typically carbon steel or low-alloy steel—that is metallurgically bonded to one or more layers of corrosion- or wear-resistant alloy materials. This structure combines the mechanical strength and cost-effectiveness of the base pipe with the superior surface properties of the alloy layer, such as enhanced corrosion or abrasion resistance. Metallurgically clad pipes offer reduced weight and material usage compared to full-alloy pipes, and are widely employed in industries such as oil & gas pipelines, chemical processing, power generation, and marine or desalination applications. The upstream of metallurgically clad pipes covers the smelting and processing of carbon steel or low alloy base pipes and corrosion-resistant/wear-resistant alloy materials; the downstream includes pipe manufacturing, engineering installation and its application and operation and maintenance in the oil and gas, chemical, seawater treatment, electric power and other industries.

The global Metallurgically Clad Pipes market size was estimated at USD 945.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
