Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Metering Low Voltage Current Transformer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the production of metering low-voltage current transformers reached 33.7141 million units, with an average selling price of US\$9.27 per unit. The single-line production capacity of metering low-voltage current transformers is approximately 500,000 units per year, with a gross profit margin of approximately 37.25%. A metering low-voltage current transformer is an electrical device used to convert high currents into smaller secondary current signals (typically 1 A or 5 A) for accurate measurement and monitoring in energy meters, protective measuring equipment, or secondary circuits. The upstream sector of the metering low-voltage current transformer industry chain is the foundation of the industry, and its technological level and supply stability directly impact the performance and quality of midstream products. Key raw materials include silicon steel sheets (which form the magnetic core, whose magnetic permeability and loss directly affect transformer accuracy), copper wire (for winding coils), and various insulation materials (to ensure electrical safety). The midstream sector is the core link, responsible for the design, production, and sales of transformers, and is also the main battlefield for technological innovation. The broad application demand in the downstream sector is the core driving force behind the industry, primarily in the industrial, construction, and electrical sectors.

The global Metering Low Voltage Current Transformer market size was estimated at USD 313.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
