MET exon 14 skipping (METex14 Skipping) is a specific genetic mutation found in non-small cell lung cancer (NSCLC) patients. This mutation leads to structural abnormalities in the MET tyrosine kinase protein, affecting cell signaling pathways and promoting cancer cell growth and survival. Targeted therapies for METex14 skipping mainly include MET inhibitors, such as Capmatinib and Tepotinib, which effectively inhibit MET kinase activity, block cancer cell growth signals, slow disease progression, and improve patient survival and quality of life. Since patients with METex14 skipping often respond poorly to traditional chemotherapy or immunotherapy, targeting MET has become a crucial treatment strategy for this group.

The global METex14 Skipping Treatment market size was estimated at USD 176.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
