## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Methanol Automotive Fuel competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Methanol fuel is an alternative biofuel for internal combustion and other engines, either in combination with gasoline or independently. Methanol (CH<sub>3</sub>OH) is less expensive to produce sustainably than ethanol fuel, although it produces more toxic effects than ethanol and has lower energy density than gasoline. Methanol is safer for the environment than gasoline, is an anti-freeze, keeps the engine clean, has a higher flashpoint in case of fire, and is the equivalent of super high-octane gasoline in terms of the resulting horsepower. It can readily be used in most modern engines with a simple software setting tweak and occasionally a change in a cheap fuel seal or line. To prevent vapor lock in any possible circumstances due to being a simple, pure fuel, a small percentage of other fuel or certain additives can be included. Methanol (a methyl group linked to a hydroxyl group) may be made from hydrocarbon or renewable resources, in particular natural gas and biomass respectively. It can also be synthesized from CO<sub>2</sub> (carbon dioxide) and hydrogen. Methanol fuel is currently used by racing cars in many countries but has not seen widespread use otherwise. Offering advantages such as a high octane rating, cleaner combustion with lower emissions, and compatibility with modified existing engines, methanol can be produced from natural gas, coal, biomass, or even renewable hydrogen and captured CO<sub>2</sub>. However, its adoption has been limited due to challenges like its lower energy density (requiring larger fuel tanks), corrosivity demanding specialized materials, lack of widespread refueling infrastructure, and safety concerns around toxicity. Despite these hurdles, ongoing innovations in blend technologies, engine design, and emerging green methanol production are gradually positioning it as a feasible transitional fuel in

regions like China, North America, and Europe.

The global Methanol Automotive Fuel market size was estimated at USD 300.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
