## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Methionine Feed Additive competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Methionine feed additives are essential amino acid supplements used in animal feed to meet the methionine nutritional requirements of farmed animals such as poultry, pigs, and fish. They can improve animal growth performance, increase feed conversion and protein utilization efficiency, and reduce the overuse of protein raw materials (such as soybean meal and fish meal) in feed. Common forms include L-methionine, DL-methionine, and their derivatives (such as the methionine hydroxy analog MHA). The upstream supply chain for methionine feed additives primarily includes chemical raw materials (such as methanol, propylene, and hydrogen cyanide), synthesis processes (chemical and fermentation), and related production equipment, providing the foundation for methionine production. The downstream supply chain encompasses feed manufacturers, animal nutrition product distributors, and farmers. Methionine feed additives are used in feed formulations for pigs, poultry, and aquaculture to improve protein utilization efficiency and animal growth performance, forming a complete industry chain from raw materials to end-use applications. In 2024, global methionine feed additive production reached 407,830 tons, with an average selling price of US\$2,631 per ton. The production capacity is 537,254 units, with a capacity utilization rate of 75.91% and a gross profit margin of 33%.

The global Methionine Feed Additive market size was estimated at USD 1073.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
