Abstracts

Methscopolamine Bromide is an anticholinergic medication primarily used to treat gastrointestinal conditions such as peptic ulcers, irritable bowel syndrome, and excessive gastric acid secretion by inhibiting the action of acetylcholine on smooth muscles and secretory glands in the digestive tract. It is also utilized off-label for managing symptoms associated with motion sickness and certain types of functional bowel disorders due to its ability to reduce spasms and secretions. The compound is typically available in oral tablet form, often in combination with other agents like analgesics or sedatives, and functions as a quaternary ammonium derivative of scopolamine, which limits its ability to cross the blood-brain barrier, thereby reducing central nervous system side effects compared to tertiary anticholinergics.

The global Methscopolamine Bromide market size was estimated at USD 15.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
