Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Methyl Silsesquioxane competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Methyl Silsesquioxane (MSQ) is an organosilicon compound with the general formula $(\text{CH}_3\text{SiO})_n$, characterized by a cage-like or network structure formed by silicon, oxygen, and methyl groups. It is widely used as a low-dielectric constant (low-k) material in semiconductor fabrication, particularly as an interlayer dielectric in integrated circuits. MSQ is also employed in coatings, hydrophobic surface treatments, and as a precursor for ceramic materials due to its excellent thermal stability, oxidation resistance, and film-forming properties. It is typically processed via sol-gel methods and is soluble in various organic solvents. Methyl Silsesquioxane (MSQ), with the general formula $(\text{CH}_3\text{SiO})_n$, typically appears as a clear liquid or white powder and exhibits a density of around 1.1-1.4 g/cm³. It has a low dielectric constant ($k \approx 2.6-2.9$), making it suitable for use as an interlayer dielectric in integrated circuits. MSQ is thermally stable with decomposition temperatures exceeding 400°C and has a glass transition temperature typically ranging from 150°C to 300°C. It is soluble in various organic solvents like ethanol, toluene, and isopropanol, and can be applied via spin coating to form films from 100 nm to 2 μm thick. The material is highly hydrophobic and optically transparent, with a refractive index around 1.41-1.47, making it valuable in electronics and coatings applications.

The global Methyl Silsesquioxane market size was estimated at USD 374.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.40% during the forecast period.
